

EVER WONDER WHERE YOUR CHILD IS LOOKING WHEN THEY ARE READING?

Modern eye-tracking technology can now show you how your child's eyes are moving across the printed page.

Deficits in eye movement coordination can cause symptoms such as:

- **Loss of place when reading**
- **Rereading or skipping lines of print**
- **Fatigue with reading**
- **Letter reversals**
- **Difficulty sounding out words**
- **Poor reading comprehension**
- **Confusing similar looking words**
- **Loss of interest in reading**
- **Short attention span**

One in four children have vision deficits, which can hinder learning.

**The Reading Eye Q test is
available in our office.**

**Talk to the office staff if you would like to schedule a RightEye reading test.
